

TOLECARD

97101 Kit

Unique DRY sanding system (up to and including P3000) for the removal of imperfections. The advantages are numerous. It is cleaner than wet sanding and you can see what you're sanding with ease. It will enable you to finish the sanding process much quicker. It also reduces the risk of sanding through clear coat to a minimum. A great advantage, after all, sanding through the clear coat means you will have to re-start the painting process all over again. The Tolecut system combines aggressiveness and uniformity. In combination with Buflex Dry Black (P3000) as final sanding step before polishing, the Tolecut system provides minimal polishing time. This Kovax system is a modern sanding/polishing system, with the emphasis on total labour time. More sanding and less polishing is the key to success. With only one additional sanding step (of just a few seconds), a highly uniform sanding scratch is generated, causing a **remarkable reduction of total polishing time** (of several minutes!). On the contrary, with conventional systems the emphasis is on polishing. Prior to polishing, the imperfection is removed in just 1 - 2 sanding steps. Due to that, much more polishing time is required to remove the final sanding scratches. Tolecut is in particular very suitable for ceramic and water based clear coats.

Cuts buffing time down
